

## One and Two Zone Water Leak Detection Equipment

Sized at 120mm x 120mm x 60mm deep, the one and two zone water detection units have been designed to monitor critical areas for water leaks via spot sensors or linier cable. Any number of spot sensors or a maximum of 50 metres of linier water detection cable can be connected to each zone. The range comes as standard with monitoring of the interconnecting cable between the sensors and the control unit. Any disconnection of the sensors from the controller will instigate a "Sensor Fault" alarm. Complete with an audible warning device, mute push button, flashing 8mm red alarm lamp and 8mm Control live green lamp, the sensor monitoring circuit includes an 8mm tri-coloured LED, red (fault) /green (Normal) lamps per zone. Once a water leak has been detected, the controllers red "Alarm" lamp will start to flash, the audible warning device will start and the common alarm relay will close. The unit will remain in this condition even if the water is removed from the sensor. Only muting the alarm will stop the sounder, turn on the lamp permanently and de-latch the alarm. If water is removed from the sensor before pressing the "Mute Alarm" button, after Muting the alarm lamp will extinguish indicating that no water is present and the common alarm relay de-energise. However if water is still being detected only the audible warning will stop leaving the lamp permanently on and the relay energised. Only when the water has been removed will the lamp extinguish and the relay de-energise. Both units have a common alarm set of volt free contacts for onward signalling to Building Management Systems (BMS), telephone dialler, control systems and Water Shut Off valves. Each zone is provided with a sensitivity potentiometer housed within the electronic interface box. This has been provided to allow individual zones to be set to high sensitivity for sensitive areas or low sensitivity for areas known to experience high humidity or water splashes. Unlike other water detection units on the market, our units use a bi-directional (AC) signal within the sensors. Using alternating current stops electrolyses which causes the sensors to disintegrate and a system unable to detect water. The use of alternating current also allows the sensors to be continually

monitored even when submersed in water. This allows the system to self reset after water has been removed for the sensor and no further action to reinstate or reset the system is required from the Operator.

### **Features**

- Large indication LED lamps for ease of Alarm identification from a distance
- On board audible warning device to alert local operators of a problem
- Alarms latched until Mute operated to give indication of transient water leaks
- Common alarm relay to onward signal to a BMS or used to shutdown water valves
- Lamps, relay and Horn test Facility to ensure that the unit is working correctly
- Zone signal isolation to stop multiple alarms due to sensors coming into contact with Earth
- Small foot print, wall or surface mounted
- Monitoring of each zone cable and sensor to ensure continuity and integrity
- A Bi-directional DC signal in the sensors to stop electrolyses and polarization
- Individual Zone sensitivity adjustment allowing any zone to be set for high to low sensitivity
